

MURALI PRASANTH

Senior Full-Stack Engineer | React · Node.js · TypeScript · REST APIs

Bangalore, India | +91 90254 65713 | muraliprasanth706@gmail.com | [LinkedIn](#) | [GitHub](#) | [LeetCode](#) | [Portfolio](#)

PROFESSIONAL SUMMARY

Full-stack engineer shipping production SaaS at product companies across JavaScript/TypeScript, React, and Node.js. Architected and owned a Node.js Backend-for-Frontend layer between a React UI and downstream Java microservices, and contributed to two large-scale frontend re-platforms (GWT to React, Angular to React), including the performance work that cut JavaScript bundle size by 30%. Designs and delivers multi-tenant systems end to end — high- and low-level design, REST API and access-control modelling, MySQL/MongoDB data design, and production debugging. Builds daily with AI-assisted development tooling, with judgement about where it does and does not belong.

TECHNICAL SKILLS

Languages: JavaScript (ES6+), TypeScript, Java

Frontend: React.js, React Native, Next.js, Context API, Custom Hooks, TanStack Query, Code Splitting & Lazy Loading, Tailwind CSS, HTML5, CSS3

Backend & APIs: Node.js, Express.js, Backend-for-Frontend (BFF), RESTful API Design, JWT & Session Authentication, Spring Boot

Databases: MySQL, MongoDB, Redis

Cloud & DevOps: AWS (S3, EC2, Lambda), CI/CD, GitHub Actions, Docker, NGINX, Linux, Git & GitHub

Architecture & Design: System Design (HLD & LLD), Microservices, Micro Frontends, Multi-Tenant RBAC, Event-Driven & Asynchronous Processing, Modular Design

Testing & Quality: Jest, Unit & Integration Testing, Code Reviews, Postman, Jira

AI & Automation: Multi-Agent Extraction Pipelines, AI-Assisted Development, OpenCV Document Preprocessing

WORK EXPERIENCE

Software Engineer II | Inresco Technology

Mar 2026 – Present | Coimbatore, India

AI-Powered Document Processing Platform — Multi-Tenant SaaS

- Owned end-to-end design and delivery of an AI-powered document processing platform that automated structured data extraction across five document types: resumes, identity documents, educational certificates, payslips, and bank statements.
- Produced the high- and low-level design for a modular multi-agent extraction pipeline — one specialised agent per document type, with asynchronous processing to raise throughput — so new document types plug in without modifying existing agents.
- Shipped secure REST APIs with API-key authentication and SMB file-share integration, backed by a post-processing layer for validation, normalization, deduplication, and source mapping to guarantee downstream data quality.
- Persisted extracted document data in MongoDB, modelling flexible per-document-type schemas so new extraction fields could be added without migrations.
- Built an intelligent preprocessing layer in OpenCV — automatic deskewing, orientation correction, PDF page segmentation, and document classification — improving extraction accuracy on low-quality scanned inputs.

APEX (NP 360) — Multi-Tenant Expert & Quote Platform

- Designed and implemented multi-tenant Role-Based Access Control for expert and quote management, enforcing strict data isolation across client organizations sharing the same infrastructure, with every query scoped by tenant in MySQL.
- Introduced a scoped External Organization Editor role enabling controlled approval workflows while preventing unauthorized publishing and administrative actions.
- Extended expert and quote management REST APIs with new business workflows, improving backend service maintainability and scalability as the product surface grew.
- Introduced Redis caching for frequently accessed expert and quote data, reducing database load and improving retrieval latency on the platform's hottest read paths.

Self-Care & Shopping Cart Platform — Node.js BFF & Authentication

- Architected and owned a Node.js/Express Backend-for-Frontend layer that centralized authentication and orchestrated REST calls between the React UI and downstream Java microservices, giving the frontend a single stable contract.
- Unified two incompatible authentication mechanisms (access-token and session-based) behind one abstraction layer, removing per-integration auth handling from client code.
- Modernized the authentication architecture by migrating legacy flows to JWT with secure token validation and refresh-token handling, and migrated auth flows from Angular to React (v16 to v18).
- Wrote Jest unit and integration tests covering BFF endpoints and authentication flows, and reviewed peer pull requests as part of a Git-based workflow with GitHub Actions running builds and tests on every change.

Pricing Studio — Core Billing Product

- Re-platformed six core billing modules (Products, Taxes, Bundles, Discounts, Policies, Partners) from legacy GWT to React, retiring a deprecated framework and raising maintainability, scalability, and team velocity.
- Modernized legacy Products and Promotions APIs into RESTful services over MySQL-backed billing data, redesigning request/response contracts to standardize frontend integration.
- Designed a reusable React component layer using Context API and custom hooks, eliminating duplicated UI code and accelerating delivery of subsequent modules.
- Reduced JavaScript bundle size by 30% and improved Time-to-Interactive using React.lazy, code splitting, and memoization — validated across 1,000+ real-world use cases.

Service Desk — Cross-Platform Application (Android, iOS, Web)

- Architected a cross-platform React Native application shipping to Android, iOS, and Web from a single shared codebase, with secure REST integrations, authentication, and TanStack Query for data fetching, caching, and offline sync.
- Designed a flexible backend tagging system with dynamic tagging and priority management, improving ticket categorization and cross-team collaboration.
- Improved response times by 10–15% through API optimization, React Native performance work, and Redis caching of high-frequency ticket searches.
- Integrated Service Desk with the Self-Care platform, letting users view, track, and manage support tickets from a single interface.

PROJECTS

UGC Desk — Multi-Tenant Creator CRM SaaS (in progress) | React, Node.js, Spring Boot, MySQL

- Architecting a microservices-based SaaS platform from scratch — React frontend, Node.js services for payments and notifications, and Spring Boot services for authentication and CRM core — to own the full high- and low-level design end to end.
- Designed the multi-tenant data model with workspace-scoped access on every query to prevent cross-tenant data exposure, JWT-based stateless authentication, and optimistic locking on concurrent writes.

Smart Healthcare Appointment System | React, React Native, Node.js, PostgreSQL

- Shipped a complete MVP in 3 days using AI-assisted development: a doctor-facing dashboard and a patient mobile app on a Node.js/PostgreSQL backend.
- Implemented real-time appointment queue tracking with estimated consultation times, giving patients live visibility into wait status and reducing post-booking uncertainty.
